Projects

Weather app - Build using Angular & Node Js

- The weather app i made using openweather API in javaScript .
- The app tells the current locations latitude and longitude and some additional information like real feel, humidity etc.
- The purpose of this app is user with real time weather information, forecast and other weather related data.

Blog application- Build sing Node Js, express & Mongodb

- The blog application with two set of users: bloggers & readers. bloggers use to create posts, edit post & submit post for review by their editors.
- Readers use to view new post on a particular blog as they are published, read individual blog post, comments, like on these posts.
- I create this application is to provide hassle-free accessing of the posted blog, entries, topics etc.
